

# Angled-Bay Measuring Guide

## Vertical Blinds

1

You will need to allow 75mm for the head rail of our Vertical Blinds (this includes the required clearance for the louvres to turn). If you have window handles or vents that stick out from the window frame, measure how far these protrude and add this to the head rail depth. This will be used as measurement (A).

You will need:-

- 2 no. Pieces of A4 or A5 sized paper or card.
- Pencil.
- Metal Tape-measure.
- Ruler.

2

Using two pieces of paper, place them edge to edge and mark both of them at the required measurement (A).

3

Slide the two pieces of paper towards each other along the window sill of the bay until the two marks that you made meet up.

4

Using a pencil, make a mark on the window sill at the point where the paper meets the window frame.

5

Measure from one mark to the next as detailed in the diagram. This will establish the width of the blind that you will need to order.

6

Measure the drop from where the top of the blind will sit down to where you want the blind to end (typically the window sill). Reduce this measurement by 15mm (1.5cm) to ensure that the fabric will not drag. All of the blinds should then be ordered as 'Exact Fitting'.
